UNITED STATES DEPARTMENT OF AGRICULTURE  
SOIL CONSERVATION SERVICE

TO RECIPIENTS OF COOPERATIVE SNOW SURVEY  
AND WATER SUPPLY FORECAST REPORTS:

Forecasts by U. S. Weather Bureau of total annual streamflow October-September, inclusive, at more than 300 gaging stations are issued monthly January through May in the publication WATER SUPPLY FORECASTS FOR THE WESTERN UNITED STATES.

Weather Bureau forecasts of runoff presented in that bulletin are computed from procedures based on mathematical analysis of the relation between precipitation and runoff.

The Weather Bureau bulletins may be secured by writing to:

Hydrologist in Charge  
River Forecast Center  
U. S. Weather Bureau  
712 Federal Office Building  
Kansas City 6, Missouri

For current information on local river and flood conditions, reference should be made to the appropriate River District Office, listed below:

Meteorologist in Charge.....	Missouri River and
Weather Bureau Office	tributaries above
Box 1705	Fort Peck Dam; Milk
Helena, Mont.	River

Meteorologist in Charge.....	Yellowstone River
Weather Bureau Airport Station	and tributaries.

Montana Agricultural Experiment Station  
Bozeman, Montana

Report issued by:

Truman C. Anderson  
State Conservationist  
of Montana

M. M. Kelso, Director  
Montana Agricultural  
Experiment Station

WATER SUPPLY OUTLOOK  
FOR THE SEASON 1954 AS OF MAY 1, 1954

\* \* \* \* \*

\* The 1954 snow-pack over the Upper Missouri Basin \*  
\* in Montana is very close to the average year flow. \*  
\* \* \* \* \*

\* The Sun, Marias and Teton Rivers have an exception- \*  
\* ally large snow-pack this season. Continued cold \*  
\* weather through April and additional snowfall has \*  
\* increased the flood potential on these three basins. \*  
\* \* \* \* \*

\* The snow-pack over the Yellowstone River Basins \*  
\* through Montana averages approximately 120% average \*  
\* and should produce a good water supply through \*  
\* April and September. \*  
\* \* \* \* \*

\* In the Columbia River Basin in western Montana, the \*  
\* snow-pack on the Clarks Fork River is very close to \*  
\* average while the snow covering the Flathead River \*  
\* Basin is considerably above average for May 1. \*  
\* \* \* \* \*

\* The Kootenai River Basin north of the Flathead has \*  
\* a record high snow-pack for this year. Flood po- \*  
\* tential exists for all low water installations \*  
\* along this river. \*  
\* \* \* \* \*

\* \* \* \* \*

JEFFERSON RIVER:

The Upper Missouri Basin tributary to the south on the Jefferson and Beaverhead Rivers is slightly below average, although it is anticipated a FAIR WATER SUPPLY will result from melting snow. Beaverhead at Barratts is forecasting its flow 84 percent average or 171,000 acre feet. The Jefferson River at Sappington will flow approximately 80 percent average or 949,000 acre feet.

MADISON RIVER:

The snow covering on the Madison River has not changed a great deal during April due to colder weather and additional precipitation. This stream will flow approximately 96 percent normal, at West Yellowstone and comparable amounts down to Three Forks.

GALLATIN RIVER:

The 1954 snow-pack on the Gallatin River Basin is almost as large as last year and not quite as large as 1952. The water supply for the irrigation season is forecast to be 95% average for this year. The shut-off dates this season will be approximately same as last year, probably a few days earlier, depending upon May-June precipitation and the date of peak on the Gallatin. Cold weather will retard the snow-melt and the peak may come later this Spring.

#### MISSOURI MAIN STEM:

The Main Stem of the Missouri from Toston to Fort Benton will carry slightly below average flow of water this irrigation season, about 92% average and very similar to last season.

The Sun, Teton and Marias Rivers will have exceptionally high flow this season. The snow pack on these basins is a record high. A FLOOD POTENTIAL exists at the present time. Cool weather has presented melting at high elevations. The longer the cool weather lasts, the worse the situation will be. The snow density is very high which also aggravates the situation by hastening the snow-melt process once the weather becomes warm.

#### UPPER YELLOWSTONE RIVER:

May 1 snow surveys conducted in and about Yellowstone Park indicate that this years water supply in the Yellowstone River above Livingston is going to be very similar to last year, or 107% average. Cold weather during the month of April has prolonged the snow-melt season and will probably produce higher peak flows than occurred last year, as soon as the weather becomes warmer.

#### COLUMBIA RIVER BASIN:

Snow measurements made at several courses on the Clarks Fork Basin on or about May 1 indicate an excellent water supply for this season. Most of the snow measurements were higher than last year, but valley precipitation has been very close to average during April. It is anticipated that there will be sufficient water for irrigation during the summer months. The Bitterroot valley will probably experience a lower flow than occurred last year. At Nezperce Pass, the snow water content this season was 9.7 inches as compared with 16 inches last season and an average for 17 years of 10 inches. Other snow courses measured in this basin have relatively the same comparison. The snow-pack on the Bitterroot Mountains to the south and west of Missoula is exceptionally high, probably the greatest depth and water content ever measured on these courses in the past 17 years.

At Hoodoo Summit, south of Superior, the snow is 152 inches deep containing 76 inches of water, as measured by the forest service. The average water content for this snow survey course is 36 inches. Although the drainage area into the Clarks Fork is small, the stream entering the river along this range will have an exceptionally high runoff during the snow-melt season.

#### FLATHEAD BASIN:

The snow on the higher tributaries on the Flathead Basin have an exceptionally high snow-pack this season, approximately 40% higher than last year and 130% average. The snow-pack on Desert Mountain above Coram is 45 inches deep containing 18 inches of water. Last year, the water content was 13 inches and the 17-year average was 10 inches.

In the neighborhood of Big Mountain, the snow is 88 inches deep with 36 inches of water. Last year, this same spot showed 30 inches of water and the 12-year average is 27 inches. Other snow courses in the high mountains have roughly the same comparisons. The North Fork of the Flathead is forecast to flow 118% of average during the period April through September. The Middle Fork is expected to flow 140% of average during the same period and the South Fork 132% or 2,980,000 acre feet from April through September. These figures

...the ... of ...

are approximately 25 percent higher than last year.

KOOTENAI BASIN:

The Kootenai River Basin has the largest snow-pack ever recorded during the past 17 years. The contributing areas from the Kootenai in Canada are also exceptionally high and April precipitation has been above average. A definite flood hazard exists on this river basin for the Spring run-off period. All low water installations and river island livestock should be moved to prepare for high water during the month of June and July. Cold weather over the entire basin has kept the snow from melting; as soon as warm weather begins, the river will probably rise very rapidly to dangerous heights.

The University of Chicago Press is a not-for-profit corporation organized under the laws of the State of Illinois. Its purpose is to publish and distribute books, journals, and other publications of interest to the academic community. The Press is governed by a Board of Trustees, and its operations are managed by a President and a Vice President. The Press is committed to the highest standards of scholarship and to the advancement of knowledge through the publication of the finest works of the human mind.
